

Sequence

(1) 看是否能用求函数极限的方法判断出 sequence 为 convergent / divergent.

△ 若要使用洛必达法则, 一般要先转成函数 (用 thm). (L'H rule 需函数连续, sequence 不满足).

$$\text{if } \lim_{x \rightarrow \infty} f(x) = L \text{ and } f(n) = a_n, \text{ where } n \text{ is integer. then } \lim_{n \rightarrow \infty} a_n = L$$

(2) 是否能够得到 convergent / divergent (常搭配 squeeze theorem).

(3) 是否为 递归数列 ($a_{n+1} = (\dots) a_n$)

△ 重点: mathematical induction (数学归纳法)

step1: 提出规律 $\Rightarrow$ step2: 证明 $n=1$ 时适用 $\Rightarrow$ step3: 假设该规律适用于任意数 $n=k$ $\Rightarrow$ step4: 对 $n=k+1$ 也成立 (成立) ^(v)

~~~~~  
Way I: 使用 Monotonic Sequence Theorem.

Bounded + monotonic sequence  $\Rightarrow$  convergent.

step1: show sequence is monotonic (only decrease or increase). / 对应函数 increase, decrease 判断

$\Rightarrow$  use mathematical induction: 先算出前两项, 假设对  $n=k$  成立, 验证  $n=k+1$  时满足.

step2: Show sequence is bounded. (例解中会给出, eg: always be positive)

$\Rightarrow$  use mathematical induction: 先算出前几项直到找到 bound, 用 induction 证明.

Way II: 先假设 convergent. 若找到 B) convergent

$$\text{eg: } a_1 = 2, a_{n+1} = \frac{72}{1 + a_n}$$

use property of limit

$$\text{Suppose } \lim_{n \rightarrow \infty} a_n = L \Rightarrow \lim_{n \rightarrow \infty} a_{n+1} = L \Rightarrow \lim_{n \rightarrow \infty} \frac{72}{1 + a_n} = L \Rightarrow \frac{72}{1 + L} = L \Rightarrow L \text{ 有解 (convergent).}$$

## Series (常指 power series - 级数). $\Rightarrow$ 判断 convergent / divergent

①. 给了 series 式子  $\Rightarrow$  求极限

②. 没给 series, 给的是对应的 sequence 的式子.

a). 是长的是 geometric series / p-series  $\Rightarrow$  可以直接判断

b). divergent test (Harmonic:  $\sum \frac{1}{n}$ , diverge. 可以直接用).

c). alternative test  $\Rightarrow$  判断 convergent

$\triangle$  限制条件最多. 可以优先判断.  $\Rightarrow a_n = (-1)^n b_n$  且  $b_n \rightarrow 0$  + decrease (需用 induction / 对应函数证明)

$\triangle$  若出现  $(-1)^n$  也可能用: thm (absolute / conditional convergent). 判断.

d). ratio test (最常用, 式子最明显, 第一个判断).

e). 若算出  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = L < 1 \Rightarrow$  放缩后可以尝试 root test. (对于  $a_n = (b_n)^n$  模式的可以直接用).

f). integral test (最后用, 限制条件多且难算).  $f$  is continuous, positive, decreasing on  $[1, \infty)$

---

## Power Series $\Rightarrow$ 考察 power series 的收敛范围和收敛半径. 端点用 test in series 检验.

$\triangle$  general form:  $\sum_{n=0}^{\infty} C_n (x-a)^n$

$\triangle$  Three possibilities: ①. convergent at  $x=a$ .  $\Rightarrow R=0$ .

②. convergent at every points  $\Rightarrow R=\infty$

③. positive number  $R$  s.t.  $|x-a| < R \Rightarrow$  series converges,  $R$  is convergent radius  
 $> R \Rightarrow$  diverges.

$\Rightarrow$  最经常搭配 ratio test, 由于  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = L < 1$  会得到收敛半径  $R$ .

$\Rightarrow$  检验 end point 确定 interval of convergence.

## Representation of Function $\Rightarrow$ 素 + geometric series.

$$\sum_{n=1}^{\infty} ar^{n+1} \text{ or } \sum_{n=0}^{\infty} ar^n, \text{ when } |r| < 1 \Rightarrow \lim_{n \rightarrow \infty} \sum_{n=1}^{\infty} ar^{n+1} = \frac{a}{1-r}.$$

$\Delta$  可能搭配 power series 的导数和积分情况 eq:  $\frac{1}{(1+x)^2} = \frac{1}{1+x}, \tan^{-1}x = \int \frac{1}{1+x^2} dx$

## Taylor Series

类型 1: 写出 a 点处前 n 项泰勒近似  $\Rightarrow f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(a)}{n!} (x-a)^n$

类型 2: Taylor inequality 求 bound / 求 error

$$|R_n(x)| \leq \frac{M}{(n+1)!} |x-a|^{n+1}, \quad |f^{(n+1)}(x)| \leq M. \quad (M \text{ 为一个 bound}).$$

$\Delta$  若  $\lim_{n \rightarrow \infty} |R_n(x)| = 0$  则函数式等于泰勒表达式.
